

ABSTRACT OF THE INVENTION

5 The invention is directed to novel indazole peptidomimetic compounds
which are useful as thrombin receptor antagonists for the treatment of diseases
associated with thrombosis, restenosis, hypertension, heart failure, arrhythmia,
inflammation, angina, stroke, atherosclerosis, ischemic conditions,
Angiogenesis related disorders, cancer, and neurodegenerative disorders.
Pharmaceutical compositions comprising the substituted indazole
10 peptidomimetics of the present invention and methods of treating conditions
mediated by the thrombin receptor are also disclosed.
